

The Problems...

Foam insulation break down.

Many home owners have discovered to their dismay that the foam insulation in their ceiling space has disintegrated into a fine, dusty powder. This could be a hazard to asthmatics and allergy sufferers. The thermal insulation effectiveness of this product will be minimal.

Collapsed or sagging ceilings.

Structural problems with ceilings can develop over time and may necessitate ceiling replacement or repair. The presence of loose fill insulation makes that a difficult job. We can vacuum all or part of the loose fill insulation to enable the repairs to proceed.

Some insulation has insect problems.

Cozy Aussie p/l has received requests from home-owners for removal of loose-fill wool insulation due primarily to insect infestation (carpet beetle). Repeated treatments by pest control specialists have, in the past, proved ineffective and total removal of the infested insulation has been the only option. Ceiling cleaning will solve the problem.

Dust, sand or leaves in your ceiling?

Home-owners living in coastal areas (particularly those with tiled roofs or open eaves) may find a build up of beach sand in their roof space over a period of years. Equally, those living in a bushland environment may find a build up of leaves creating a potential fire hazard in their roof space. Ceiling cleaning can solve the problem and vacuum the ceiling clean.
